

```
/******  
** Multiscan SDK 2.7 JAVA READ ME  
******/
```

This document refers to the Java wrapper provided for GreenBit Multiscan SDK.

The following general considerations are valid:

- The Java Wrapper is given "as is" with its source code, in order to be customizable
- Source code is organized as follows:
 1. Two directories are given: "DEPENDS", where libraries the wrapper lies on are present; "SOURCE CODE", where .java source code files (divided by packages) are present.
 2. No project files are present, so that customer can use the preferred tool
 3. For library wrappers, result of compilation (a .jar archive) is present in the directory of the wrapper, while for example applications, the result is moved to the general "RUN" directory, and the libraries it lies on are given in the "RUN\Lib" directory (this Class-path can be modified by editing the "Manifest.mf" file present in the .jar archive of the applications)
 4. For each application, a launcher is present in the "RUN" directory (a batch - .bat - for Windows systems, a shell - .sh - for Linux systems)
